Abstract The purpose of this study was to determine whether there were differences in the prevalence of self-reported depression between men and women who had been exposed to violence during childhood and adulthood. Data from the National Longitudinal Study of Adolescent Health (*N = 9,800*) were used to examine the association between exposure to violence and self-reported depression among adolescents. Results showed that exposure to violence during childhood and adulthood was associated with higher rates of self-reported depression. Furthermore, the association between exposure to violence and self-reported depression was stronger for women than for men.

[illegible]

Abstract The purpose of this study was to determine whether the use of a computerized program designed to teach the basic concepts of statistics would increase students' understanding of statistical concepts. A pretest-posttest design was used. Students completed a pretest before using the program and a posttest after completing the program. Results indicated that students who used the program showed significantly higher scores than those who did not use the program on all items except one item related to the concept of correlation.
